

Biological active compounds in food: benefits and risks

Ing. Miriam Solgajová, PhD.

**Faculty of Biotechnology and Food Sciences
SLOVAK UNIVERSITY OF AGRICULTURE IN NITRA**

Bioactive compounds

Bioactive compounds occur:

- ▶ in many different forms with different effects on the human or consumer physiology
- ▶ Bioactive compounds due to their benefits are added to conventional food and such food is called

Functional food

Selected functional components

- ▶ Dietary fibre
- ▶ Oligosaccharides
- ▶ Alcoholic sugars
- ▶ Peptides and proteins
- ▶ Probiotics and prebiotics
- ▶ Polyunsaturated fatty acids (PUFA s)
- ▶ Minerals
- ▶ Vitamins
- ▶ Polyphenols and other plant antioxidants

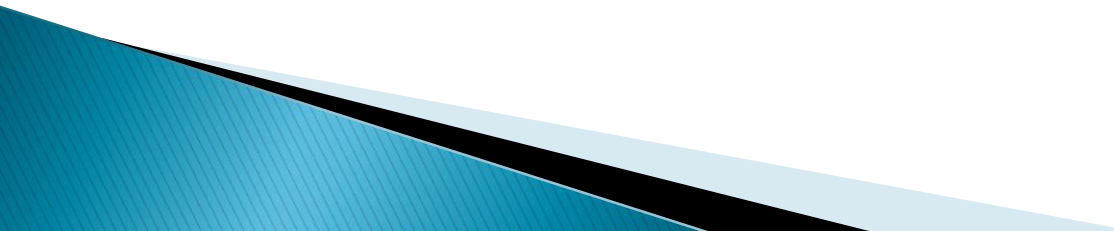

Bioactive carbohydrates

- ▶ are **sources of energy** in our diet, but certain structural characteristics enable their use beyond basic nutrition.
- ▶ the most important structural feature is **resistance to digestion** in the upper tract of gastrointestinal tract.
- ▶ it becomes **food for microflora** (beneficial bacteria) that converts them into bioactive compounds

Bioactive carbohydrates

- ▶ Trehalose
 - ▶ Polysaccharides
 - ▶ Soluble fiber
 - ▶ Insoluble fiber
 - ▶ Resistant starches
 - ▶ Slowly digestible starch
 - ▶ Prebiotics (fructooligosaccharides)
 - ▶ Polyphenols as prebiotics
- 

Sources of carbohydrates

- ▶ Fruit
- ▶ Vegetable
- ▶ Cereals
- ▶ Meat
- ▶ Milk – glucose, lactose, oligosaccharides
- ▶ Eggs
- ▶ Honey

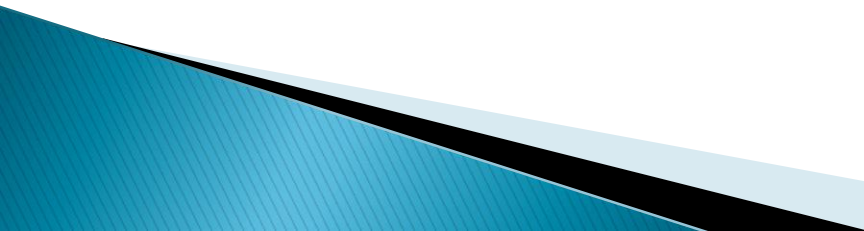

Bioactive proteins and peptides

Bioactive proteins presence:

- ▶ **Animal** – lactoferin, lysozyme, lactoperoxydase, angiotension converting enzyme (ACE)- inhibitors, phospopeptides
- ▶ **Plant** – ACE-inhibitors, protease inhibitors etc.

Main biofunctionalities of proteins

- ▶ Anti-hypertension
 - ▶ Immunity response
 - ▶ Probiotic support of intestinal flora
 - ▶ Inflammation amplification agents production control
 - ▶ Satiety inducing peptides
 - ▶ Insulino-tropic effect
 - ▶ Antioxidants
 - ▶ Recovery after exhaustion, stress
 - ▶ Calcium binding
- 

Bioactive proteins and peptides

▶ **Bioactive peptides:** are food driven peptides that in addition to their nutritional value exert a physiological effect in the body.

▶ **Sources:**

▶ milk, fish, gelatin, wheat, soy

▶ **Daily intake:** 10-15% of energy intake

Bioactive lipids

Main groups of lipids:

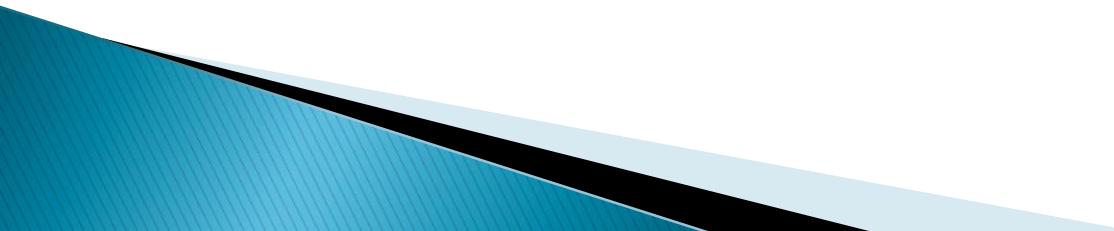

- ▶ triglycerides, phospholipides, sphingolipides,
- ▶ cholesterol, waxes

Sources:

- ▶ **Saturated fats:** meats, baked goods, full-fat dairy products, coconut, palm and its kernel
- ▶ **Monounsaturated fats:** canola, olive, peanut, high oleic sunflower, sunflower oils and nuts
- ▶ **Polyunsaturated fats:** vegetable oils, walnuts, flaxseeds, fish and fish products

Effects of lipids

- ▶ Excellent energy reserves
 - ▶ Structure of cell membranes
 - ▶ Organ padding and body thermal insulation
 - ▶ Essential fatty acids
 - ▶ Hormone synthesis
 - ▶ Fat soluble vitamin absorption
- 

Antioxidants

- ▶ Antioxidants are our first line of defense against free radical damage, and are critical for maintaining optimum health and wellbeing.
- ▶ Cell damage caused by free radicals appears to be a major contributor to aging and to diseases such as:
 - ▶ cancer, cardiovascular disease,
 - ▶ cataracts, immune system decline,
 - ▶ and brain dysfunction

Sources of food antioxidants

Synthetic antioxidants

- synthetic antioxidants are mainly phenolic and include butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), tert-butyl hydroquinone (TBHQ) and propyl, octyl and dodecyl gallates.

Antioxidants permitted for use in foods in the EU

Antioxidant	E number
Ascorbic acid	E 300
Sodium ascorbate	E 301
Calcium ascorbate	E 302
Mixed natural tocopherols	E 306
Propyl gallate	E 310
Butylated hydroxyanisole	E 320
Butylated hydroxytoluene	E 321
Lecithins	E 322
Citric acid	E 330

Some naturally occurring antioxidants

- ▶ Amino acids
- ▶ Carnosine
- ▶ Citric acid
- ▶ B-carotene
- ▶ Curcumin
- ▶ Lecithin
- ▶ Phytic acid
- ▶ Saponins
- ▶ Flavonoids
- ▶ Lignans
- ▶ Phenilic acids
- ▶ Sterols
- ▶ Uric acid
- ▶ Vitamin C
- ▶ Vanillin.....

Polyphenols

- ▶ Polyphenols (natural antioxidants) are secondary plant metabolites distributed throughout the plant kingdom that contribute to the plant defense system against environmental stressors like UV radiation, attack by pathogens
- ▶ are effective nutrients in the prevention of oxidative stress-related diseases such as cancer and heart diseases

Natural Colorants

- ▶ natural colorants are substances obtained from foods and other natural sources by physical and/or chemical extraction that results in selective extraction of the pigments.

According to COLOUR we recognize:

- ▶ violet and blue – anthocyanins,
- ▶ green – chlorophylls,
- ▶ yellow – flavonoids, carotenoids, chinons, vulgaxantins,
- ▶ orange – carotenoids,
- ▶ red – anthocyanins, betalains, carotenoids.

BIOLOGICAL EFFECTS

- ▶ catalysators of biochemical reactions,
- ▶ component of enzymes, provitamins,
- ▶ gas transporters, antioxidants.

Vitamins

- ▶ are heterogeneous group of substances and are vital nutrients that must be obtained from the diet
- ▶ We recognize 13 substances as being vitamins:
- ▶ fat-soluble vitamins K, A, D, E
- ▶ water soluble vitamins C, B1, B2, B6, B12, niacin, panthothenic acid, biotin

Minerals

- ▶ Minerals are inorganic elements which remain behind in the ash when food is incinerated
- ▶ They are divided in two groups:
 - ▶ **macro minerals**
 - ▶ **micro minerals**
- ▶ Minerals are classified as essential or non-essential.
- ▶ Non-essential are also categorized as either toxic or non-toxic.

Potential risks of BAC

- ▶ **allergic reaction** in organism (colours, fiber)
- ▶ in high concentration could be **toxic** (polyphenols)
- ▶ higher content of **beta glucans** in barley causes reduced filterability, formation of gels and hazes in the beer, cause a „soupy“ effect and the beer is no longer sharp and fresh

Thank you for your attention
